#### **The Sorites Paradox**

The view that the right solution to the sorites paradox is to reject the "border-crossing" premise is called the epistemic view - since, on this view, the only real problem with a sorites argument is that we do not know which premise is the false one!

#### **The sorites paradox**

the sorites argument can be thought of as having a rather special sorites premise: For any objects  $x, y$ , if  $x$  looks the same as  $y$  and  $x$  is red, then  $y$  is red This certainly seems hard to deny This is sometimes called the 'phenomenal sorites', and it raises interesting issues of its own 2

### **Heaps, Experience, and Method: On the Sorites Argument in ...**

The sorites paradox is particularly difficult, since it indicates that either the principle of bivalence is jeopardized or we have to accept other problematic conclusions If we want to preserve the principle of bivalence, we should assume that somewhere in the border-line there is a cut-off point such that on one side the predicate applies and
